

# YOU CAN CONSTRUCT $G$ -COMMUTATIVE ALGEBRAS ONE NORM AT A TIME

NATALIE STEWART

**ABSTRACT.** We define the category of  $G$ -operads and the hierarchy of *generalized  $N_\infty$ -operads*, which are  $G$ -suboperads of  $\text{Comm}_G^\otimes$ . We exhibit an isomorphism between the category of generalized  $N_\infty$ -operads and the self-join poset

$$\text{Op}_G^{GN_\infty} \simeq \text{Ind} - \text{Sys}_G \star \text{Ind} - \text{Sys}_G,$$

where  $\text{Ind} - \text{Sys}_G$  is the poset of *indexing systems* in  $G$ . This recognizes generalized  $N_\infty$ -operads as parameterizing *some commutative multiplicative transfers and possibly a commutative multiplication*. Indeed, their algebras in semiadditive Cartesian categories are incomplete Mackey functors and their algebras in Mackey functors recover incomplete Tambara functors when they are  $N_\infty$  operads, i.e. when they contain  $\mathbb{E}_\infty$ .

After this, we discuss some in-progress research. Namely, we construct a *Boardman-Vogt tensor product* of  $G$ -operads and demonstrate that tensor products of generalized  $N_\infty$  operads correspond with joins in  $\text{Ind} - \text{Sys}_G \star \text{Ind} - \text{Sys}_G$  i.e. there is an  $N_{(I \vee J)_\infty}$ -monoidal equivalence

$$\text{Alg}_{N_{I_\infty}} \text{Alg}_{N_{J_\infty}} C \simeq \text{Alg}_{N_{(I \vee J)_\infty}} C$$

for all  $N_{(I \vee J)_\infty}$ -monoidal categories  $C$ , allowing  $G$ -commutative structures to be constructed “one norm at a time.”

**Foreword.** The following are notes prepared for a casual talk in the [zygotop](#) seminar concerning research which is currently in-progress. The reader should read with the understanding that they are particularly error-prone, as the non-cited results herein amount to the communication of a pre-draft of a paper in a casual setting. The reader should also henceforth implicitly insert the text  $\infty$ - before the words operad and category.

## 1. INTRODUCTION

In [\[Dre71\]](#), the concept of a *Mackey functor* was introduced; this structure was described as consisting of functors  $M_I : \mathcal{O}_G \rightarrow \mathbf{Mod}_R$  and  $M_R : \mathcal{O}_G^{\text{op}} \rightarrow \mathbf{Mod}_R$  which agree on  $\mathcal{O}_G^\sim$  and satisfying the *double coset formula*

$$R_J^H I_K^H = \prod_{x \in [J \setminus H / K]} I_{J \cap x K x^{-1}}^J \cdot \text{conj}_x R_{x^{-1} J x \cap K}$$

for all  $J, K \subset H$ , where  $R_J^K := M_R(G/J \rightarrow G/K)$  and similar for  $I$ . The ur-example of this is the assignment  $H \mapsto A(H)$ , where  $A(H)$  is the representation ring of  $H$ , with covariant functoriality  $\text{Ind}$  and contravariant functoriality  $\text{Res}$ . This was repackaged and generalized into the modern definition of the *category of  $C$ -valued  $G$ -Mackey functors*

$$\mathcal{M}_G(C) := \text{Fun}^\times(\text{Span}(\mathbb{F}_G), C),$$

where  $\mathbb{F}_G$  denotes the category of finite  $G$ -sets.

In parallel, the concept of *transfer maps in group cohomology* was being developed in [\[Eve63\]](#), later lifted to genuine equivariant cohomology in [\[GM97\]](#), and finally developed as a functor

$$N_H^G : \text{Sp}_H \rightarrow \text{Sp}_G$$

in [\[HHR16\]](#), which played a crucial role in the solution to the Kervaire invariant one problem. This functor is meant to represent the *indexed tensor power*, e.g.  $\text{Res}_e^G N_e^G X \simeq X^{|G|}$ , and the associated action is meant to represent the permutation action of  $G$  on the factors. These were noted in [\[HH16\]](#) to satisfy the conditions of a *Symmetric monoidal Mackey functor*, a notion they distinguished from their notion of  *$G$ -symmetric monoidal categories* due to coherence issues.

In the broad program announced in [\[Bar+16\]](#), the correct notion of  *$G$ -symmetric monoidal  $G$ - $\infty$ -categories* (henceforth  *$G$ -symmetric monoidal categories*) was introduced:

**Definition 1.1.** Let  $C$  have finite products. Then, the category of  $G$ -commutative monoids in  $C$  is

$$\mathbf{CMon}_G(C) := \mathcal{M}_G(C).$$

The category of  $G$ -symmetric monoidal categories is  $\mathbf{CMon}_G(\mathbf{Cat})$ .

We similarly define the *category of small  $G$ -categories* as

$$\mathbf{Cat}_G := \text{Fun}(\mathcal{O}_G^{\text{op}}, \mathbf{Cat}) \simeq \mathbf{Cat}_{/\mathcal{O}_G^{\text{op}}}^{\text{cocart}},$$

where the equivalence is the *straightening-unstraightening construction* of [HTT], and  $\mathcal{O}_G^{\text{op}} \subset \mathbb{F}_G$  denotes the full subcategory of transitive  $G$ -sets, henceforth referred to as the *orbit category*. We may informally summarize the structure of a  $G$ -symmetric monoidal category  $C^\otimes \in \mathbf{CMon}_G(\mathbf{Cat})$  as consisting of, for every conjugacy class  $(H)$  of  $G$ , a category with Weyl group action  $C_H \in \mathbf{Cat}^{BW_G H}$ , as well as functors

$$\begin{aligned} \otimes_H^2 : C_H^2 &\rightarrow C_H, \\ N_K^H : C_K &\rightarrow C_H, \\ \text{Res}_K^H : C_H &\rightarrow C_K \end{aligned}$$

for all subconjugacy classes  $(K)$  of  $(H)$ . These are supplied with coherent data recognizing them as associative, commutative, unital, and compatible with each other and the Weyl group action. The maps  $\text{Res}$  encode an underlying  $G$ -category  $C$  of  $C^\otimes$ , and  $N_K^H$  is pronounced “the norm from  $K$  to  $H$ .”

Given  $C^\otimes$  a  $G$ -symmetric monoidal category, we may informally define a  $G$ -commutative algebra in  $C$  to be a tuple of objects  $(X_H) \in \prod_{G/H \in \mathcal{O}_G} C_H$  satisfying

$$X_H \simeq \text{Res}_H^G X_G$$

together with structure maps

$$\begin{aligned} \mu_H^2 : X_H^{\otimes 2} &\rightarrow X_H \\ \text{tr}_K^H : N_K^H X_K &\rightarrow X_H \end{aligned}$$

for all  $H \subset K$ , together with coherent associativity, commutativity, and unitality data. We may intuitively view these data as altogether specifying that these structure maps jointly construct a contractible space of maps

$$X^{\otimes S} \rightarrow X_H$$

for all finite  $H$ -sets  $S \in \mathbb{F}_H$ , where

$$X^{\otimes S} := \bigotimes_{H/K \in \text{Orb}(S)} N_K^H X_K.$$

The map  $\text{tr}_K^H$  is pronounced “the transfer from  $K$  to  $H$ .” When  $C^\otimes = \mathcal{M}_G(C)^\otimes$  with the *HHR norm*  $G$ -symmetric monoidal structure of [HH16], these are called  *$G$ -Tambara functors valued in  $C$* .

This talk concerns various relaxations of the notion of  $G$ -commutative algebras. Namely, we will define a symmetric monoidal closed category  $\text{Op}_G$  of (colored)  $G$ -operads, whose internal hom  $\mathbf{Alg}_O^\otimes(C)$  is called the *operad of algebras under pointwise tensors*, and whose tensor product is called the *Boardman-Vogt tensor product*.

We are particularly interested in  $\mathcal{N}_\infty$  operads, which interpolate between  $\mathbb{E}_\infty$  and the  $G$ -operad  $\text{Comm}_G$  which encodes  $G$ -commutative algebras by adding a subset of the transfers parameterized by  $\text{Comm}_G$ . These transfers are required to be structured according to the notion of a *transfer system*.

**Definition 1.2.** A  $G$ -transfer system is a core-preserving wide subcategory  $\mathcal{O}_G^\approx \subset T \subset \mathcal{O}_G$  which is closed under subconjugacy. An *indexing system* is a wide subcategory  $I \subset \mathbb{F}_G$  induced by a transfer system under taking coproducts.

A *generalized indexing system* is a core-preserving subcategory  $I \subset \mathbb{F}_G$  which is either an indexing system or is attained by one by removing all non-isomorphisms of trivial  $H$ -sets. The poset of indexing systems under inclusion is denoted  $\text{Ind} - \text{Sys}_G$ , and the poset of generalized indexing systems is denoted  $\text{Ind} - \text{Sys}_G^\sim$ .

It is not hard to see that there is an equivalence of posets

$$\widehat{\text{Ind} - \text{Sys}_G} \simeq \text{Ind} - \text{Sys}_G \star \text{Ind} - \text{Sys}_G,$$

and in particular, generalized indexing systems decompose into two different join-stable copies of indexing systems, depending on whether maps of trivial  $G$ -sets are included.

Given a generalized indexing system  $I$ , we will construct an operad called  $\mathcal{N}_{I\infty}^\otimes$  encoding precisely the maps  $\text{tr}_K^H$  such that  $K \hookrightarrow H$  is in  $I$ , as well as encoding the map  $\mu_H$  if and only if  $I$  is an indexing system. The main theorem of this talk characterizes the tensor products of generalized  $\mathcal{N}_\infty$  operads.

**Theorem A.** *There is a fully faithful and symmetric monoidal inclusion*

$$\mathcal{N}_{(-)\infty}^\otimes : \widehat{\text{Ind} - \text{Sys}_G} \xhookrightarrow{\Pi} \text{Op}_G^\otimes$$

whose image consists of the  $G$ -suboperads of  $\text{Comm}_G^\otimes$ , and when restricted to the indexing systems has image consisting of  $G$ -operads  $\mathcal{O}^\otimes$  possessing diagrams  $\mathbb{E}_\infty^\otimes \subset \mathcal{O}^\otimes \subset \text{Comm}_G^\otimes$ . In particular, for  $\mathcal{C}^\otimes$  an  $\mathcal{N}_{(I\vee J)\infty}$ -monoidal category, there is a canonical  $\mathcal{N}_{(I\vee J)\infty}$ -monoidal equivalence

$$\underline{\text{Alg}}_{\mathcal{N}_{I\infty}}^\otimes \underline{\text{Alg}}_{\mathcal{N}_{J\infty}}^\otimes \mathcal{C} \simeq \underline{\text{Alg}}_{\mathcal{N}_{(I\vee J)\infty}}^\otimes \mathcal{C}.$$

We say an inclusion of subgroup  $H \subset K$  is *atomic* if it is proper and there exist no chains of proper subgroup inclusions  $H \subset J \subset K$ . More generally, we say that a conjugacy class  $(H) \in \text{Conj}(G)$  is an *atomic subclass* of  $(K)$  if there exists an atomic inclusion  $\tilde{H} \subset \tilde{K}$  with  $\tilde{H} \in (H)$  and  $\tilde{K} \in (K)$ , and we say that  $(K)$  is atomic if the canonical inclusion  $1 \hookrightarrow K$  is atomic.

Given  $(H) \subset (K)$  an atomic subclass, we refer to the  $\mathcal{N}^\infty$ -operad corresponding to the minimal index system containing the inclusion  $H \hookrightarrow K$  as  $\mathcal{N}^\infty(H, K)$ . When  $(H) = (1)$ , we instead simply write  $\mathcal{N}^\infty(K)$ .

**Corollary B.** *Let  $1 = G_n \subset G_{n-1} \subset \dots \subset G_0 = G$  be a maximal subgroup series of a finite group, and let  $\mathcal{C}$  be a  $G$ -symmetric monoidal category. Then, there exists a canonical  $G$ -symmetric monoidal equivalence*

$$\underline{\text{Alg}}_{\mathcal{N}^\infty(G_1, G_0)}^\otimes \cdots \underline{\text{Alg}}_{\mathcal{N}^\infty(G_n, G_{n-1})}^\otimes \mathcal{C} \simeq \underline{\text{CAlg}}_G^\otimes \mathcal{C}$$

Furthermore, if  $G \simeq H \times J$ , then

$$\underline{\text{CAlg}}_H^\otimes \underline{\text{CAlg}}_J^\otimes \mathcal{C} \simeq \underline{\text{CAlg}}_G^\otimes \mathcal{C}.$$

*Remark.* One may worry about the comparison between models for  $G$ -operads, as our notion of  $\mathcal{N}_\infty$ -operads is ostensibly embedded deep within the world of  $G$ - $\infty$ -operads, which are not known to be equivalent to the  $\infty$ -category presented by the graph model structure or by genuine  $G$  operads.

However, some work has been done to simplify the story of  $\mathcal{N}_\infty$  operads in the model story; in particular, by [Rub21, Thm 2.16, 3.6], the full  $\infty$ -category of the  $\infty$ -category of *genuine*  $G$ -operads is equivalent to  $\text{Ind} - \text{Sys}_G$  via a functor  $A$  which sits in a commutative diagram

$$\begin{array}{ccc} \text{Op}_G^{\text{gen}, \mathcal{N}^\infty} & \xrightarrow{N|_{\mathcal{N}^\infty}} & \text{Op}_G^{\mathcal{N}^\infty} \\ & \searrow A & \downarrow A \\ & & \text{Ind} - \text{Sys}_G \end{array}$$

where we use that the functor  $N$  of [BP21] is canonically  $\infty$ -categorical when restricted to full subcategories of  $\text{Op}_G^{\text{gen}}$  which happen to be 1-categories and map to a 1-subcategory of  $\text{Op}_G$ . Both functors named  $A$  are equivalences (c.f. [Ex 2.4.7]Nardin), and hence  $N|_{\mathcal{N}^\infty}$  is an equivalence.

## 2. THE IDEAS

**2.1. Fibrous patterns.** In order to precisely define  $G$ -operads, the most efficient way will be to go through the technology of *algebraic patterns*, a concept first defined by German mathematician Honyi Chu and the Norwegian mathematician Rune Haugseng, who generally referred to them using the letter  $\mathcal{O}$ .

**Definition 2.1.** An *algebraic pattern* is an  $\infty$ -category  $\mathcal{F}$ , together with a factorization system  $(\mathcal{F}^{\text{int}}, \mathcal{F}^{\text{act}})$  of  $\mathcal{F}$  and a full subcategory  $\mathcal{F}^{\text{el}} \subset \mathcal{F}^{\text{int}}$ . The *category of algebraic patterns* is the full subcategory

$$\text{AlgPatt} \subset \text{Fun}(D, \text{Cat})$$

spanned by algebraic patterns, where  $D := \bullet \rightarrow \bullet \rightarrow \bullet \leftarrow \bullet$ .

Maps in  $\mathcal{F}^{\text{int}}$  and  $\mathcal{F}^{\text{act}}$  are pronounced *inert* and *active maps*, and objects of  $\mathcal{F}^{\text{el}}$  are pronounced *elementary objects*. For instance,  $\mathbb{F}_*$ , together with its inert and active maps as defined in [HA, § 2] and elementary objects  $\{\langle 1 \rangle\}$  determines an algebraic pattern. In analogy with [HA, § 2], we will use these to develop a notion of operads, called *fibrous patterns*.

**Definition 2.2.** Let  $\mathcal{F}$  be an algebraic pattern. A *fibrous  $\mathcal{F}$ -pattern* is a map of algebraic patterns  $\pi : \mathcal{O} \rightarrow \mathcal{F}$  such that

- (1)  $\mathcal{O}$  has  $\pi$ -cocartesian lifts for inert morphisms of  $\mathcal{F}$ ,
- (2) (Segal condition for colors) For every active morphism  $\omega : V_0 \rightarrow V_1$  in  $\mathcal{F}$ , the functor

$$O_{V_0}^\simeq \rightarrow \lim_{\alpha \in \mathcal{F}_{V_1/}^{\text{el}}} O_{\omega_{\alpha,!} V_1}^\simeq$$

induced by cocartesian transport along  $\omega_\alpha$  is an equivalence, where  $\omega_{(-)} : \mathcal{F}_{Y/}^{\text{el}} \rightarrow \mathcal{F}_{X/}^{\text{int}}$  is the inert morphism appearing in the inert-active factorization of  $\alpha \circ \omega$ , and

- (3) (Segal condition for multimorphism) for every active morphism  $\omega : V_1 \rightarrow V_2$  in  $\mathcal{F}$  and all objects  $X_i \in \mathcal{O}_{\mathcal{F}_{V_i/}}$ , the commutative square

$$\begin{array}{ccc} \text{Map}_{\mathcal{O}}(X_0, X_1) & \longrightarrow & \lim_{\alpha \in \mathcal{F}_{V_1/}^{\text{el}}} \text{Map}_{\mathcal{O}}(X_0, \omega_{\alpha,!} X_1) \\ \downarrow & & \downarrow \\ \text{Map}_{\mathcal{F}}(V_0, V_1) & \longrightarrow & \lim_{\alpha \in \mathcal{F}_{O_1/}^{\text{el}}} \text{Map}_{\mathcal{F}}(O_0, \omega_{\alpha,!} O_1) \end{array}$$

is cartesian.

A fibrous  $\mathcal{F}$ -pattern  $\pi : \mathcal{C} \rightarrow \mathcal{F}$  is a *Segal  $\mathcal{F}$ -category* if  $\pi$  is a cocartesian fibration. The category of fibrous  $\mathcal{F}$ -patterns is the full subcategory

$$\text{Fbrs}(\mathcal{F}) \subset \text{AlgPatt}_{/\mathcal{F}}$$

spanned by fibrous patterns, and the category of Segal  $\mathcal{F}$ -categories is the full subcategory of

$$\text{Seg}_{\mathcal{F}}(\text{Cat}) \subset \text{Cat}_{/\mathcal{F}}^{\text{cocart}}$$

spanned by Segal  $\mathcal{F}$ -categories.

We state one technical lemma:

**Lemma 2.3.** *All of the inclusions*

$$\text{Seg}(\mathcal{F}) \rightarrow \text{Fbrs}(\mathcal{F}) \hookrightarrow \text{AlgPatt}_{/\mathcal{F}} \rightarrow \text{Cat}_{/\mathcal{F}} \rightarrow \text{Cat}$$

*have left adjoints; in particular, the full subcategory  $\text{Fbrs}(\mathcal{F}) \subset \text{AlgPatt}_{/\mathcal{F}}$  is localizing.*

We refer to the left adjoint  $\text{Env} : \text{Fbrs}(\mathcal{F}) \rightarrow \text{Seg}(\mathcal{F})$  as the *Segal envelope*, and we use it analogously to the *symmetric monoidal envelope*, reducing the question of characterizing maps of fibrous patterns into Segal  $\mathcal{F}$ -categories into simply a question of characterizing maps of Segal  $\mathcal{F}$ -categories, which is much simpler.

#### Example 2.4:

**Definition 2.5.** Given the data of  $\mathcal{X}$  a category,  $\mathcal{X}_b, \mathcal{X}_f$  wide subcategories, and  $\mathcal{X}_0 \subset \mathcal{X}_b$  a full subcategory, we define the *span pattern*  $\text{Span}_{b,f}(\mathcal{X}; \mathcal{X}_0)$  to have:

- underlying category  $\text{Span}_{b,f}(\mathcal{X})$  whose objects are objects in  $\mathcal{X}$  and whose morphisms  $X \rightarrow Z$  are spans

$$X \xleftarrow{B} Y \xrightarrow{F} Z$$

with  $B \in \mathcal{X}_b$  and  $F \in \mathcal{X}_f$ .

- inert morphisms  $\mathcal{X}_b^{\text{op}} \subset \text{Span}(\mathcal{X})$ .
- active morphisms  $\mathcal{X}_f \subset \text{Span}(\mathcal{X})$ .
- Elementary objects  $\mathcal{X}_0^{\text{el}} \subset \mathcal{X}_b^{\text{op}}$ .

Then, for instance we have the following:

**Theorem 2.6** ([BHS22]). *Pullback along the inclusion  $\mathbb{F}_* \hookrightarrow \text{Span}(\mathbb{F})$  induces an equivalence on the categories of fibrous patterns and Segal categories.*

**2.2. G-operads and I-operads.** There is an adjunction

$$\text{Tot} : \mathbf{Cat}_G \rightleftarrows \mathbf{Cat} : \text{CoFr}^G$$

where Tot takes the total category of a cocartesian fibration and  $\text{CoFr}^G(C)$  is classified by functor categories

$$\text{CoFr}^G(C)_H := \text{Fun}(O_H^{\text{op}}, C)$$

with functoriality dictated by pullback. In particular, the *G-category of small G-categories*  $\underline{\mathbf{Cat}}_G := \text{CoFr}^G(C)$  has G-fixed points given by  $\mathbf{Cat}$ .

*Remark.* Elmendorf's theorem may be reinterpreted in this language as the statement that the *G-category of G-spaces*  $\underline{\mathcal{S}}_G$  is G-cofreely generated by  $\mathcal{S}$ .

Let  $\mathbb{F}_G := \text{CoFr}^G(\mathbb{F})$  and let  $\mathbb{F}_{G,*} := \text{CoFr}^G(\mathbb{F}_*)$ . Then, there is an equivariant lift of [theorem 2.6](#).

**Theorem 2.7** ([BHS22]). *Pullback along the composition  $\mathbb{F}_{G,*} \hookrightarrow \text{Span}(\text{Tot}\mathbb{F}_G) \xrightarrow{U} \text{Span}(\mathbb{F}_G)$  induces an equivalence on the categories of fibrous patterns and Segal categories, where  $\mathbb{F}_G$  is the category of G-sets.*

**Definition 2.8.** The category of G-operads is the category of fibrous patterns

$$\text{Op}_G := \text{Fbrs}(\text{Span}(\mathbb{F}_G)).$$

If  $O, \mathcal{P}$  are G-operads, the category of *O-algebras in P* is the functor category of algebraic patterns

$$\mathbf{Alg}_O(\mathcal{P}) := \text{Fun}_{\text{AlgPatt}}(O, \mathcal{P}).$$

We may equivalently characterize *O-algebras in P* as functors which preserve cocartesian lifts of inert morphisms. In order to identify G-operads, we use the following exercise in category theory which was carried out in [BHS22, § 5.2].

**Proposition 2.9.** *An identity-on-objects functor  $\pi : O \rightarrow \text{Span}(\mathbb{F}_G)$  is a G-operad if and only if it satisfies the following conditions:*

- (1) *O has  $\pi$ -cocartesian lifts for inert morphisms of  $\text{Span}(\mathbb{F}_G)$ .*
- (2) *For every map of G-sets  $S \rightarrow T$ , the inert morphisms  $\{U \leftarrow T \mid U \in \text{Orb}(T)\}$  induce equivalences*

$$\text{Map}_O(S, T) \simeq \prod_{U \in \text{Orb}(T)} \text{Map}_O(S, U).$$

Furthermore, a cocartesian fibration  $\pi : O \rightarrow \text{Span}(\mathbb{F}_G)$  is a Segal  $\text{Span}(\mathbb{F}_G)$ -category if and only if it unstraightens to a G-symmetric monoidal category.

We may further reorganize this through the following elementary lemma about G-sets.

**Lemma 2.10.** *The assignment  $\varphi : T \mapsto \text{Ind}_H^G T \rightarrow G/H$  underlies an equivalence of categories*

$$\mathbb{F}_H \simeq (\mathbb{F}_G)_{/G/H}.$$

Write  $\Sigma_G \simeq \text{CoFr}^G(\mathbb{F}^\infty)$ . By applying [lemma 2.10](#) and taking cores of slice categories, we construct a forgetful functor

$$O_{\text{sseq}} : \text{Op}_G^{\text{one-object}} \rightarrow \text{Fun}(\text{Tot}\Sigma_G, \mathcal{S})$$

with value on  $S \in \mathbb{F}_H$  given by  $\pi_O^{-1}(\text{Ind}_H^G S \rightarrow G/H)$ . We refer to  $O(S) := O_{\text{sseq}}(S)$  as the *space of S-ary operations*. This functor is further analyzed in [section 3.1](#), where e.g. it is shown to be conservative.

An early observation about genuine equivariant homotopy coherent algebraic structures is that the structure of transfers *does not come canonically* from an  $\mathbb{E}_\infty$ -structure; that is,  $\mathbb{E}_\infty \in \text{Op}_G$  is not terminal. The failure of  $\mathbb{E}_\infty$  to be terminal is parameterized by the category of *generalized  $N^\infty$ -operads*:

**Definition 2.11.** Write  $\text{Comm}_G^\otimes := (\text{Span}(\mathbb{F}_G) = \text{Span}(\mathbb{F}_G))$  for the terminal  $G$ -operad. A  $G$ -operad  $\mathcal{O}^\otimes$  is a *generalized  $N^\infty$ -operad* if the unique morphism  $\mathcal{O}^\otimes \rightarrow \text{Comm}_G^\otimes$  is a monomorphism, i.e. it has one object and

$$\mathcal{O}(S) \in \{*, \emptyset\}$$

for all  $S \in \mathbb{F}_H$ .

A generalized  $N^\infty$  operad  $\mathcal{N}_{\infty I}$  is an  $N^\infty$  operad if it admits a map

$$\mathbb{E}_\infty \rightarrow \mathcal{O}^\otimes,$$

i.e.  $\mathcal{O}(S) \simeq *$  whenever  $S \in \mathbb{F}_H$  has trivial  $H$ -action.

Write  $\text{Op}_G^{GN^\infty}$  for the full subcategory consisting of generalized  $N_\infty$ -operads. The following proposition is an exercise in category theory, and establishes that a map to an  $N_\infty$  operad is a *property*, not a structure.

**Proposition 2.12.** *Given  $\mathcal{N}_{I\infty} \in \text{Op}_G^{GN^\infty}$  a generalized  $N_\infty$  operad, the forgetful functor*

$$\text{Op}_{G,/\mathcal{N}_{I\infty}} \rightarrow \text{Op}_G$$

*is fully faithful.*

*Proof idea.* It is equivalent to prove that  $\text{Map}(\mathcal{O}, \mathcal{N}_{I\infty}) \in \{*, \emptyset\}$  for all  $\mathcal{O} \in \text{Op}_G$ . In fact, there is a localizing (1-) subcategory  $N : \text{Op}_{1,G} \hookrightarrow \text{Op}_G$  consisting of operads whose structure spaces are discrete, and whose localization functor  $h : \text{Op}_G \rightarrow \text{Op}_{1,G}$  takes  $\pi_0$  of the structure spaces.  $\mathcal{N}_{I\infty}$  evidently lies in  $\text{Op}_{1,G}$ , so we have

$$\text{Map}_{\text{Op}_G}(\mathcal{O}, \mathcal{N}_{I\infty}) \simeq \text{Hom}_{\text{Op}_{1,G}}(h\mathcal{O}, \mathcal{N}_{I\infty}).$$

Hence it suffices to check that the latter set is empty or contractible. This is easy to see in  $\text{Op}_{1,G}$ , since  $\text{Hom}(-, *)$  and  $\text{Hom}(-, \emptyset)$  are always either empty or contractible.  $\square$

In particular, this implies that  $\text{Op}_G^{GN^\infty}$  is a poset, so we'd like to identify this poset. There is a functor

$$A : \text{Op}_G \rightarrow \widehat{\text{Ind} - \text{Sys}_G}$$

called the *admissible sets* with value over  $G/H$  given by

$$A(\mathcal{O})_{/(G/H)} := \{S \rightarrow G/H \mid \pi_{\mathcal{O}}^{-1}(S \rightarrow G/H) \neq \emptyset\}$$

and extended to general  $G$ -sets by coproducts. The following proposition is an exercise in category theory (see [NS22, Ex 2.4.7], or the original references [BH15; GW18; Rub21]):

**Proposition 2.13.** *The restricted functor*

$$A : \text{Op}_G^{GN^\infty} \rightarrow \widehat{\text{Ind} - \text{Sys}_G}$$

*is an equivalence of categories.*

We denote by  $\mathcal{N}_{(-)\infty}$  the composite functor

$$\mathcal{N}_{(-)\infty} : \widehat{\text{Ind} - \text{Sys}_G} \xrightarrow{A^{-1}} \text{Op}_G^{GN^\infty} \hookrightarrow \text{Op}_G$$

Using this, we finally define *I-operads*.

**Definition 2.14.** Let  $I$  be a generalized indexing system. Then, the *category of I-operads* is the slice category

$$\text{Op}_I := \text{Op}_{G,/\mathcal{N}_{\infty I}^\otimes}.$$

Given  $\mathcal{O}^\otimes, \mathcal{P}^\otimes \in \text{Op}_I$ , the *category of  $\mathcal{O}$ -algebras in  $\mathcal{P}$*  is the full subcategory

$$\text{Alg}_{\mathcal{O}}(\mathcal{P}) \subset \text{Fun}_{/\mathcal{N}_{\infty I}^\otimes}(\mathcal{O}^\otimes, \mathcal{P}^\otimes)$$

spanned by maps of  $I$ -operads.

*Remark.* The notation  $\text{Alg}_{\mathcal{O}}(\mathcal{P})$  does not include  $\mathcal{I}$ . This presents no problem; indeed, by [proposition 2.12](#), the categories of  $\mathcal{O}$ -algebras in  $\mathcal{P}$  considered over various indexing systems (including the terminal one, i.e. in  $G$ -operads) are canonically equivalent to one another.

A useful property of these are that  $G$  operads *fibred* over  $\mathcal{O}^\otimes$  have an intrinsic description in terms of  $\mathcal{O}$ . We may state these in the language of fibrous patterns.

**Proposition 2.15** ([BHS22, Cor 4.1.17]). *Let  $O$  be a fibrous  $\mathcal{J}$ -pattern. Then, the pushforward functor  $\pi_! : \text{AlgPatt}_{/O} \rightarrow \text{AlgPatt}_{/\mathcal{J}}$  preserves fibrous patterns, and the associated functor*

$$\pi_! : \text{Fbrs}(O) \rightarrow \text{Fbrs}(\mathcal{J})_{/O}$$

*is an equivalence of categories.*

In particular, the category of  $I$ -operads is covariantly functorial in  $I$ , and it possesses an intrinsic expression along the lines of ??.

**Example 2.16:**

Let  $\mathcal{F} \subset O_G$  be a *family*, i.e. a collection of subgroups of  $G$  closed under sub-conjugation. Then,  $\mathcal{F} \cup O_G^\sim$  is a transfer system, and we denote by  $\mathcal{I}_{\mathcal{F}}$  the corresponding indexing system.

Let  $V$  be a real orthogonal  $G$ -representation, let  $\mathcal{F}_V$  is the family consisting of subgroups  $H$  such that  $V^H \neq *$ , and let  $\mathcal{I}_V := \mathcal{I}_{\mathcal{F}_V}$ . Then, there is an  $\mathcal{I}_V$ -operad  $\mathbb{E}_V$  of *little  $V$ -disks*, which may be informally understood to have  $S$ -ary operations the  $H$ -equivariant embeddings  $S \hookrightarrow V$ :

$$\mathbb{E}_V(S) \simeq \text{Conf}_H(S, V).$$

This along with a computation of the  $G$ -symmetric monoidal envelope was carried out in ??. These participate in *equivariant infinite loop space theory*, in the sense that there is a fully faithful embedding

$$\{V - \text{loop spaces}\} \hookrightarrow \mathbf{Alg}_{\mathbb{E}_V}(S_G)$$

with image given by the  $\mathbb{E}_V$  spaces satisfying a grouplike condition, up to model categorical weirdness. See [GM11] for details.

**2.3. The BV tensor product.** By lemma 2.3, the category of algebraic patterns has a cartesian monoidal structure such that the *underlying category* functor  $U : \text{AlgPatt}^\times \rightarrow \mathbf{Cat}^\times$  is symmetric monoidal.

**Definition 2.17.** The category of *symmetric monoidal algebraic patterns* is  $\text{CMon}(\text{AlgPatt})$ .

By [HA, § 2.2], a symmetric monoidal structure on  $\mathcal{J}$  endows on the slice category  $\text{AlgPatt}_{/\mathcal{J}}^\otimes$  a symmetric monoidal structure, which we may view as taking  $O, \mathcal{P}$  to the tensor product

$$O \times \mathcal{P} \rightarrow \mathcal{J} \times \mathcal{J} \rightarrow \mathcal{J}.$$

**Definition 2.18.** The *Boardman-Vogt symmetric monoidal category of fibrous  $\mathcal{J}$ -patterns* is the localized symmetric monoidal structure

$$\text{Fbrs}(\mathcal{J})^\otimes \hookrightarrow \text{AlgPatt}_{/\mathcal{J}}^\times.$$

We may view the tensor product of fibrous  $\mathcal{J}$ -patterns as yielding the localized composite

$$O \otimes \mathcal{P} := L_{\text{Fbrs}}(O \times \mathcal{P} \rightarrow \mathcal{J} \times \mathcal{J} \rightarrow \mathcal{J}).$$

Note that the category  $\mathbb{F}_G$  has finite products, and any indexing system  $\mathcal{I}$  is closed under products. In particular, this endows  $i : \mathcal{N}_{\mathcal{I}^\infty}^\otimes \rightarrow \text{Span}(\mathbb{F}_G)$  with the structure of a map of symmetric monoidal algebraic patterns under  $\text{Span}(\times)$ .

**Definition 2.19.** The *Boardman-Vogt symmetric monoidal category of  $I$ -operads* is

$$\text{Op}_I^\otimes := \text{Fbrs}(\mathcal{N}_{\mathcal{I}^\infty})$$

**Proposition 2.20.** *Given an inclusion  $i : \mathcal{N}_{\mathcal{I}^\infty} \hookrightarrow \mathcal{N}_{\mathcal{J}^\infty}$ , pushforward along  $i$  yields a functor*

$$i_! : \text{Op}_I^\otimes \rightarrow \text{Op}_{\mathcal{J}}^\otimes$$

*realizing  $\text{Op}_I$  as a symmetric monoidal colocalizing subcategory of  $\text{Op}_{\mathcal{J}}$ .*

The verification of this comes down to the following fact, which follows from the results of [HA, § 2.2.2], and is almost generalized by [Bar23, p. 2.37].

**Lemma 2.21.** *Given  $f : X \rightarrow Y$  a map of commutative algebra objects in  $\mathcal{C}$  a symmetric monoidal category, the associated functor  $f_! : \mathcal{C}_{/X} \rightarrow \mathcal{C}_{/Y}$  lifts to a canonical symmetric monoidal functor between the slice symmetric monoidal categories.*

We may “see” this fact by staring at the following commutative diagram:

$$\begin{array}{ccccc}
 & & X \otimes X & \longrightarrow & X \\
 & \nearrow & \downarrow & & \downarrow \\
 A \otimes B & & & & \\
 & \searrow & Y \otimes Y & \longrightarrow & Y
 \end{array}$$

The BV tensor product satisfies a mapping-out property; namely, we review in [section 3.3](#) the construction due to [NS22, § 5.3] of the operad  $\underline{\mathbf{Alg}}_{\mathcal{P}}^{\otimes}(Q)$ , and we prove the following theorem.

**Theorem 2.22.** *There is a natural equivalence of operads*

$$\underline{\mathbf{Alg}}_{\mathcal{O} \otimes \mathcal{P}}^{\otimes} Q \simeq \underline{\mathbf{Alg}}_{\mathcal{O}}^{\otimes} \underline{\mathbf{Alg}}_{\mathcal{P}}^{\otimes} Q$$

realizing  $\mathbf{Alg}_{\mathcal{P}}^{\otimes}(-)$  as an internal hom for the BV tensor product.

**2.4. Summary of the argument.** We would like to construct an equivalence  $\mathcal{N}_{I\infty} \otimes \mathcal{N}_{J\infty} \simeq \mathcal{N}_{(I \vee J)\infty}$ . Let’s begin with the special case  $I \subset J$ ; in this case, we can say something stronger.

**Proposition 2.23.** *If  $\mathcal{O}$  is a one-object  $G$ -operad, then the map  $\mathcal{N}^{\infty}(I) \rightarrow \mathcal{N}^{\infty}(I) \otimes \mathcal{O}$  is an  $I$ -equivalence; in particular,  $\mathcal{N}^{\infty}(I)$  is  $\otimes$ -idempotent.*

To prove this, we use [NS22, Cor 5.3.9]; in particular, they generalize [HA] to verify that any of the following conditions are true of  $\mathbf{Alg}_{\mathcal{N}^{\infty}(I)}^{\otimes}(C)$ , which recognize it as  $I$ -cocartesian:

**Lemma 2.24.** *The following are equivalent:*

- (1) *For all one-object  $I$ -operads  $\mathcal{O}$ , the forgetful functor  $\mathbf{Alg}^{\mathcal{O}}(C) \rightarrow C$  is an equivalence.*
- (2) *For all maps  $f : S \rightarrow T$  in  $I$ , the action map  $f_{\otimes} : C_S \rightarrow C_T$  is left adjoint to the pullback map  $f^* : C_S \rightarrow C_T$ .*

We prove this in ?? . Having proved this, we acquire a (unique) diagram

$$\begin{array}{ccc}
 \mathcal{N}_{I\infty} & & \\
 \searrow & \nearrow & \\
 & \mathcal{N}_{I\infty} \otimes \mathcal{N}_{J\infty} & \xrightarrow{\varphi} \mathcal{N}_{(I \vee J)\infty} \otimes \mathcal{N}_{(I \vee J)\infty} = \mathcal{N}_{(I \vee J)\infty} \\
 \nearrow & \searrow & \\
 \mathcal{N}_{J\infty} & &
 \end{array}$$

and we are tasked with proving that  $\varphi$  is an equivalence. An unfortunate fact is that the functor  $U : \mathbf{Op}_{I \vee J} \rightarrow \mathbf{Op}_I \times \mathbf{Op}_J$  doesn’t appear to be conservative in general. Our strategy will come down to trying *really hard* to make it conservative. We do so via the following two lemmas, proved as [lemmas 3.5](#) and [3.6](#).

**Lemma 2.25.** *Denote by  $i : I \cup J \subset I \vee J$  the (non-indexing system) union of subcategories. Then, the pullback*

$$\mathbf{Fbrs}(\mathbf{Span}(I \cup J)) \rightarrow \mathbf{Op}_I \times \mathbf{Op}_J$$

*is conservative and symmetric monoidal. In particular,  $U$  reflects equivalences between  $I \vee J$ -operads in the image of  $L_{\mathbf{Fbrs}} i_!$ .*

**Lemma 2.26.** *There is an equivalence  $\mathcal{N}_{(I \vee J)\infty} \simeq L_{\mathbf{Fbrs}} i_! \mathbf{Span}(I \cup J)$ .*

*Proof of theorem A.* By the above argument, it suffices to prove that  $\varphi$  is an equivalence; in fact, by [lemmas 2.25](#) and [2.26](#) and symmetry it suffices to prove that the localized functor

$$\iota_J^* \mathcal{N}_{I \cap J \infty} \otimes \mathcal{N}_{J\infty} \rightarrow \iota_J^* \mathcal{N}_{I \vee J \infty}$$

is an equivalence. But  $\iota_J^* \mathcal{N}_{I\infty} \simeq \mathcal{N}_{I \cap J \infty}$ , so the above is the inclusion  $\mathcal{N}_{I \cap J \infty} \otimes \mathcal{N}_{J\infty} \rightarrow \mathcal{N}_{J\infty}$ , which is an equivalence by [proposition 2.23](#).  $\square$

## 3. TECHNICAL NONSENSE

**3.1. Passing to monads is conservative.** Our arguments will be reminiscent of [SY19, § 2.3-2.4]. Let  $\mathbf{Fbrs}_\bullet(\mathcal{I})$  denote the full subcategory of fibrous patterns whose associated maps  $\mathcal{O}^{\text{el}} \rightarrow \mathcal{I}^{\text{el}}$  are equivalences. Define the functor  $(-)_{\text{sseq}}$  to be the composite

$$\mathbf{Fbrs}_\bullet(\mathcal{I}) \xrightarrow{\varphi} \mathbf{Fun}(\mathbf{Ar}^{\text{act}}(\mathcal{I}), \mathcal{S}) \rightarrow \mathbf{Fun}(\underline{\Sigma}_{\mathcal{I}}, \mathcal{S})$$

where  $\underline{\Sigma}_{\mathcal{I}} \subset \mathbf{Ar}^{\text{act}}(\mathcal{I})$  is the full subcategory of active arrows whose targets are elementary objects.

**Lemma 3.1** (C.f. [SY19, Prop 2.3.6]). *The functor  $(-)_{\text{sseq}}$  is conservative.*

*Proof.* Suppose  $f : \mathcal{O} \rightarrow \mathcal{P}$  induces an equivalence  $f_{\text{sseq}} : \mathcal{O}_{\text{sseq}} \simeq \mathcal{P}_{\text{sseq}}$ . By the definition of fibrous patterns, this implies that  $\varphi(f)$  is an equivalence.

Note that  $\text{Env}_{\mathcal{I}}^{\mathcal{A}} f = (-) \times_{\mathcal{O}} \mathbf{Ar}^{\text{act}}(\mathcal{O})$  is identity on objects, so it is essentially surjective; the natural transformation  $\varphi(f)$  precisely specifies the action of  $\text{Env}_{\mathcal{I}}^{\mathcal{A}} f$  on morphisms, so  $\text{Env}_{\mathcal{I}}^{\mathcal{A}} f$  is an equivalence. Since  $\text{Env}_{\mathcal{I}}^{\mathcal{A}}$  is fully faithful, this implies that  $f$  is an equivalence.  $\square$

We now specialize to the case  $\mathcal{I} = \text{Span}(I)$ . Note that  $\underline{\Sigma}_{\text{Span}(\mathbb{F}_G)} \simeq \underline{\Sigma}_G$ , where  $\underline{\Sigma}_G \simeq \text{CoFr}^G \Sigma$ . Furthermore,  $\underline{\Sigma}_{\text{Span}(I)} \rightarrow \underline{\Sigma}_G$  is fully faithful with image spanned by  $I$ -admissible  $H$ -sets; we refer to this as  $\underline{\Sigma}_I$ . Hence we may translate [lemma 3.1](#) to the following:

**Proposition 3.2.** *The forgetful functor*

$$(-)_{\text{sseq}} : \mathbf{Op}_I \rightarrow \mathbf{Fun}(\underline{\Sigma}_I, \mathcal{S})$$

*sending  $\mathcal{O}(S) := \pi_O^{-1}(\text{Ind}_H^G S \rightarrow G/H)$  for all  $S \in \mathbb{F}_H \cap I$  is conservative.*

*Remark.* The genuine model structure  $\text{Sym}_\bullet^G(\mathbf{sSet})$  of [BP22] exists and presents  $\mathbf{Fun}(\text{Tot} \underline{\Sigma}_G, \mathcal{S})$ ; the  $\infty$ -category of Genuine  $G$ -operads are then algebras over a monad on  $\mathbf{Fun}(\text{Tot} \underline{\Sigma}_G, \mathcal{S})$  which are explicitly defined in [BP21]. In this setting, [lemma 3.1](#) amounts to a verification of one of the two Barr-Beck conditions expressing  $U$  as monadic (cf [HA, Thm 4.7.3.5]), and hence we view it as a step in the direction of proving that these two models are equivalent.

We say that a  $G$ -operad  $\mathcal{O}^\otimes$  is *reduced* if  $\mathcal{O}(T) = *$  whenever  $T$  is empty or a transitive  $H$  set. Let  $\mathcal{O}^\otimes$  be a reduced  $G$ -operad,  $\mathcal{C}$  a  $G$ -symmetric monoidal category, and  $X : \text{triv}^\otimes \rightarrow \mathcal{C}^\otimes$  a  $G$ -object. Denote by  $X_{\text{sseq}} \in \mathbf{Fun}_G(\underline{\Sigma}_G, \mathcal{C})$  the functor of  $G$ -categories underlying the adjunct map of  $G$ -symmetric monoidal categories to  $X$ . We can use this to characterize the monad associated with an operad.

We say that a symmetric monoidal category is *distributive* if the action maps  $f_\otimes : \mathcal{C}_S \rightarrow \mathcal{C}_T$  preserve coproducts separately in each variable (see [NS22]).

**Proposition 3.3.** *Let  $\mathcal{O}$  be a reduced  $G$ -operad and let  $\mathcal{C}^\otimes$  be a distributive  $G$ -symmetric monoidal category. Then, the forgetful map  $\mathbf{Alg}_{\mathcal{O}}(\mathcal{C}) \rightarrow \mathcal{C}$  is monadic, and the associated monad  $T_{\mathcal{O}}$  acts on  $X \in \mathcal{C}$  as*

$$T_{\mathcal{O}} X := \text{colim } X_{\text{sseq}}.$$

*In particular, we have*

$$(T_{\mathcal{O}} X)^H \simeq \coprod_{\substack{K \subset H \\ S \in \mathbb{F}_K}} \left( \mathcal{O}(S) \otimes X^{\otimes \text{Ind}_K^H S} \right)_{h \in \text{Aut}_K S},$$

*where for all  $S' \in \mathbb{F}_H$ , we write*

$$X^{\otimes S'} := \bigotimes_{U \in \text{Orb}(S')} N_U^H X_U.$$

*Proof.* Monadicity is precisely [NS22, Cor 5.1.5] when  $\mathcal{T} = \mathcal{O}_G$ , so it suffices to compute the associated monad in this case. Note that  $X_{\text{sseq}}(S) \simeq \mathcal{O}(S) \otimes X^{\otimes S}$ , so the computation of  $(T_{\mathcal{O}} X)^H$  follows immediately from the statement  $T_{\mathcal{O}} X \simeq \text{colim } X_{\text{sseq}}$ , so it suffices to prove this statement.

By [NS22, Rem 4.3.6], the left adjoint  $\text{Fr} : \mathcal{C} \rightarrow \mathbf{Alg}_O(\mathcal{C})$  is computed on  $X$  by  $G$ -operadic left Kan extension of the corresponding map  $\text{triv}^\otimes \xrightarrow{X} \mathcal{C}^\otimes$  along the canonical inclusion  $\text{triv}^\otimes \rightarrow \mathcal{O}^\otimes$ ; the underlying  $G$ -functor of this is computed by the  $G$ -left Kan extension

$$\begin{array}{ccc} \Sigma_G & \xlongequal{\quad} & \text{Env}_O \text{triv} \xrightarrow{X} \mathcal{C} \\ \downarrow & & \downarrow \searrow \text{Fr } X \\ *_G & \xlongequal{\quad} & \mathcal{O} \end{array}$$

I.e. by the indexed colimit

$$T_O X \simeq \text{colim } X_{\text{sseq}}.$$

□

Suppose  $\mathcal{C}$  is a finitely cocomplete Cartesian closed category, and let  $\text{CoFr}^G(\mathcal{C})$  be the  $G$ -category of  $G$ -coefficient systems valued in  $\mathcal{C}$ , and write  $\mathcal{C}_G := \text{CoFr}^G(\mathcal{C})^G \simeq \text{Fun}(\mathcal{O}_G^{\text{op}}, \mathcal{C})$ . By [NS22, Prop 3.2.5] (noting that all colimits involved are finite), the  $G$ -Cartesian  $G$ -symmetric monoidal structure on  $\text{CoFr}^G(\mathcal{C})$  is distributive. Using Elmendorf's theorem, we apply this to  $\mathcal{S}_G$ :

**Corollary 3.4.** *Let  $\mathcal{O}$  be a reduced  $G$ -operad. Then, the functor  $\mathbf{Alg}_{(-)}(\underline{\mathcal{S}}_G) : \text{Op}_G^{\text{Red}} \rightarrow \mathbf{Cat}$  is conservative.*

*Proof.* All but the final statement follow by the above analysis. Suppose  $\varphi : \mathcal{O} \rightarrow \mathcal{P}$  induces an equivalence on  $\mathbf{Alg}_{\mathcal{O}}(\mathcal{S}_G) \rightarrow \mathbf{Alg}_{\mathcal{P}}(\mathcal{S}_G)$ .

Then  $\varphi$  induces a natural equivalence  $T_{\mathcal{O}, \mathcal{S}_G} \Rightarrow T_{\mathcal{P}, \mathcal{S}_G}$  respecting the summand decomposition in [proposition 3.3](#). Choosing  $X$  a set with at least 2 points, we find that  $n_S \cdot \mathcal{O}(S) \rightarrow n_S \cdot \mathcal{P}(S)$  is an equivalence for some  $n_S > 0$  and all  $S$ ; this implies that  $\mathcal{O}(S) \rightarrow \mathcal{P}(S)$  is an equivalence for all  $S$ , i.e.  $\varphi_\Sigma$  is an equivalence. By [lemma 3.1](#), this implies  $\varphi$  is an equivalence. □

**3.2. The conservativity lemmas.** We have two conservativity lemmas to prove.

**Lemma 3.5.** *Denote by  $i : I \cup J \subset I \vee J$  the (non-indexing system) union of subcategories. Then, the pullback*

$$\text{Fbrs}(\text{Span}(I \cup J)) \rightarrow \text{Op}_I \times \text{Op}_J$$

*is conservative. In particular,  $U$  reflects equivalences between  $I \vee J$ -operads in the image of  $L_{\text{Fbrs}} i$ .*

*Proof.* Passing to the underlying symmetric sequences yields a diagram

$$\begin{array}{ccc} \text{Fbrs}(\text{Span}(I \cup J)) & \xrightarrow{i^*} & \text{Op}_I \times \text{Op}_J \\ \downarrow & & \downarrow \\ \text{Fun}(\Sigma_I \cup \Sigma_J, \mathcal{S}) & \xrightarrow{\quad} & \text{Fun}(\Sigma_I, \mathcal{S}) \times \text{Fun}(\Sigma_J, \mathcal{S}) \end{array}$$

The left vertical arrow is conservative by [proposition 3.2](#). Note that  $\Sigma_I \cup \Sigma_J \simeq \Sigma_I \coprod_{\Sigma_{I \cap J}} \Sigma_J$ , so the bottom vertical arrow is simply the inclusion

$$\text{Fun}(\Sigma_I, \mathcal{S}) \times_{\text{Fun}(\Sigma_{I \cap J}, \mathcal{S})} \text{Fun}(\Sigma_J, \mathcal{S}) \hookrightarrow \text{Fun}(\Sigma_I, \mathcal{S}) \times \text{Fun}(\Sigma_J, \mathcal{S}),$$

which is conservative. Hence the diagonal composite is conservative, implying that  $i^*$  is conservative as well. □

The second is essentially similar. Note that  $\text{Env}_I \text{Span}(J) \simeq \mathbb{F}_J^{\sqcup}$  for all  $J \subset I$ , and that

$$(1) \quad \mathbb{F}_J^{\sqcup} \coprod_{\mathbb{F}_{I \cap J}^{\sqcup}} \mathbb{F}_I^{\sqcup} \simeq \mathbb{F}_{I \vee J}^{\sqcup},$$

where the coproduct is taken in the category of  $G$ -symmetric monoidal categories. We use this:

**Lemma 3.6.** *The canonical map  $L_{\text{Fbrs}} i! \text{Span}(I \cup J) \rightarrow \mathcal{N}_{(I \vee J)^\infty}$  is an equivalence.*

*Proof.* By [corollary 3.4](#), it suffices to prove that the induced map

$$\mathbf{Alg}_{\mathcal{N}_{(I \vee J)}}(\mathcal{S}_G) \rightarrow \mathbf{Alg}_{L_{\mathbf{Fbrs}!} \text{Span}(I \cup J)}(\mathcal{S}_G) \simeq \mathbf{Alg}_{\text{Span}(I \cup J)}(i^* \mathcal{S}_G)$$

is an equivalence. Unwinding definitions, this is equivalent to proving that the following diagram is cartesian:

$$\begin{array}{ccc} \text{Fun}_G^{\otimes}(\mathbb{F}_{I \vee J}, \underline{\mathcal{S}}_G) & \longrightarrow & \text{Fun}_G^{\otimes}(\mathbb{F}_I, \underline{\mathcal{S}}_G) \\ \downarrow & & \downarrow \\ \text{Fun}_G^{\otimes}(\mathbb{F}_J, \underline{\mathcal{S}}_G) & \longrightarrow & \text{Fun}^{\times}(\mathbb{F}_{I \cap J}, \underline{\mathcal{S}}_G) \end{array}$$

In fact, this is precisely (1). □

### 3.3. The BV tensor product on fibrous patterns is closed.

**Definition 3.7.** Let  $\mathcal{F}$  be a symmetric monoidal algebraic pattern. Then, a *bifunctor of fibrous  $\mathcal{F}$ -patterns* is a diagram in  $\mathbf{Fbrs}(\mathcal{F})$

$$\begin{array}{ccc} \mathcal{O} \times \mathcal{P} & \longrightarrow & \mathcal{Q} \\ \downarrow & & \downarrow \\ \mathcal{F} \times \mathcal{F} & \longrightarrow & \mathcal{F} \end{array}$$

Let  $F : \mathcal{O}^{\otimes} \times \mathcal{P}^{\otimes} \rightarrow \mathcal{F}^{\otimes}$  be a bifunctor of fibrous  $\mathcal{F}$ -patterns and let  $C^{\otimes} \in \mathbf{Fbrs}(\mathcal{F})$  be a fibrous  $\mathcal{F}$ -pattern. The following construction generalizes [\[NS22, § 5.3\]](#).

**Construction 3.8.** Define  $P : \mathcal{O}^{\otimes} \times_{\mathcal{F}^{\text{el}}} \text{Ar}(\mathcal{F}^{\text{el}}) \rightarrow \mathcal{O}^{\otimes}$  by cocartesian pushforward. We have a diagram

$$\mathcal{O}^{\otimes} \xleftarrow{\pi} \mathcal{O}^{\otimes} \times \text{Ar}(\mathcal{F}^{\text{el}}) \times \mathcal{P}^{\otimes} \xrightarrow{P \times \text{id}} \mathcal{O}^{\otimes} \mathcal{P}^{\otimes} \xrightarrow{F} \mathcal{F}^{\otimes}.$$

and an associated push-pull adjunction

$$L_{\mathbf{Fbrs}} F_!(P \times \text{id})^* \pi^* : \mathbf{Fbrs}(\mathcal{O}) \rightleftarrows \mathbf{Fbrs}(\mathcal{F}) : \pi_*(P \times \text{id})^* F^*.$$

We verify that this adjunction exists in [lemma 3.11](#). and we define  $\underline{\mathbf{Alg}}_{\mathcal{F}}^{\otimes}(\mathcal{P}; C) \rightarrow \mathcal{O}^{\otimes}$  to be  $\pi_*(P \times \text{id})^* F^*(C^{\otimes})$ .

Products of equivalences are equivalences; this proves the following lemma.

**Lemma 3.9.** *External products of strong Segal morphisms are strong Segal morphisms.*

The proof of the following lemma is precisely that of [\[CH21, Lem 9.4\]](#).

**Lemma 3.10.** *Fibrous patterns are strong Segal morphisms.*

The following is an exercise in category theory:

**Lemma 3.11.** *Fix  $(\mathcal{O}, \mathcal{O}') \in \mathbf{Cat}_{\mathcal{F}} \times \mathbf{Cat}_{\mathcal{F}}$ . Then,*

- (1)  $f \times f' : \mathcal{O} \times \mathcal{O}' \rightarrow \mathcal{F} \times \mathcal{F}$  is a (strong-, iso-) Segal morphism if and only if  $f$  and  $f'$  are (strong-, iso-) Segal morphisms.
- (2)  $\pi_{\mathcal{O} \times \mathcal{O},*}$  preserves fibrous patterns (resp. Segal categories) if and only if  $\pi_{\mathcal{O},*}$  and  $\pi_{\mathcal{O}',*}$  preserve fibrous patterns (Segal categories).
- (3)  $\mathcal{O} \times \mathcal{O}'$  is a fibrous  $\mathcal{F} \times \mathcal{F}$ -pattern (resp. Segal  $\mathcal{F} \times \mathcal{F}$ -category) if and only if  $\mathcal{O}$  and  $\mathcal{O}'$  are fibrous  $\mathcal{F}, \mathcal{F}$  patterns (Segal  $\mathcal{F} \times \mathcal{F}$ -categories).

In particular, the morphisms  $F, P \times \text{id}, \pi$  above are strong Segal morphisms and  $\pi_*$  preserves fibrous patterns and Segal categories.

*Proof.* For (1), note that the associated functor

$$\mathcal{O}_{X/}^{\text{el}} \times \mathcal{O}'_{X'}^{\text{el}} \rightarrow \mathcal{F}_{fX/}^{\text{el}} \times \mathcal{F}_{f'X'}^{\text{el}}$$

is the product  $f_{X/}^{\text{el}} \times f'_{X'}^{\text{el}}$ , so this follows by noting that products commute with limits and that a product of functors is an equivalence if and only if the factors are equivalences.

(2) should just be a formal construction of a right adjoint...Is (2) actually true? The adjunction certainly exists by [\[NS22\]](#), but it's a bit unclear what it would even mean in this context.

For (3), this amounts to checking that a morphism is  $\pi \times \pi'$ -cocartesian if and only if it's a product of  $\pi$  and  $\pi'$ -cocartesian arrows and commuting limits past products in [\[BHS22, Def 4.1.2\]](#). □

The following lemma follows immediately from [lemma 3.11](#).

**Lemma 3.12.** *Suppose  $C$  is a Segal  $\mathcal{F}$ -category. Then,  $\underline{\mathbf{Alg}}_{\mathcal{F}}^{\otimes}(\mathcal{P}; C)$  is a Segal  $\mathcal{O}$ -category.*

The resulting fibrous is pronounced “the fibrous  $\mathcal{F}$ -pattern of  $G$ -equivariant  $\mathcal{O}$ -algebras in  $C$ .”  
We specialize to the case that  $\mathcal{F}^{\otimes} = \mathcal{O}^{\otimes}$ , in which case we write

$$\underline{\mathbf{Alg}}_{\mathcal{P}}^{\otimes}(C) := \underline{\mathbf{Alg}}_{\mathcal{F}}^{\otimes}(\mathcal{P}; C).$$

Then, the above diagram instead reads as

$$\mathcal{F} \xleftarrow{\pi} \mathcal{F} \times \mathrm{Ar}(\mathcal{F}^{\mathrm{el}}) \times \mathcal{P}^{\otimes} \xrightarrow{P \times \mathrm{id}} \mathcal{F} \times \mathcal{P}^{\otimes} \xrightarrow{F} \mathcal{F}.$$

So that the left adjoint is computed by the fibrous localization of the map  $Q \times \mathcal{P} \rightarrow \mathcal{F}$  in the following:

$$\begin{array}{ccc} \pi^*(P \times \mathrm{id})!Q & \simeq & Q \times \mathcal{P} \\ \downarrow & \swarrow \pi_Q \times \mathrm{id} & \\ \mathcal{F} \times \mathcal{P} & & \\ \downarrow \mathrm{id} \times \pi_{\mathcal{P}} & \searrow F & \\ \mathcal{F} \times \mathcal{F} & \xrightarrow{\otimes} & \mathcal{F} \end{array}$$

in fact, by definition, this is precisely  $Q \otimes_{\mathcal{F}} \mathcal{P}$ . This concludes the proof of [theorem 2.22](#).

As a sanity check, we verify that our construction matches that of [\[NS22, § 5.3\]](#). Draw the diagram

$$\begin{array}{ccccc} \mathcal{F}^{\otimes} \times_G \mathrm{Ar}(\mathcal{O}_G^{\mathrm{op}}) \times_G \mathcal{P}^{\otimes} & \xrightarrow{P \times \mathrm{id}} & \mathcal{F} \times_G \mathcal{P}^{\otimes} & \xrightarrow{f} & \mathcal{F}^{\otimes} \\ \pi' \swarrow & \downarrow \iota & \downarrow & \searrow f & \\ \mathcal{F}^{\otimes} \times \mathrm{Ar}(\mathcal{O}_G^{\mathrm{op}}) \times \mathcal{P}^{\otimes} & \xrightarrow{P \times \mathrm{id}} & \mathcal{F} \times \mathcal{P}^{\otimes} & \xrightarrow{f} & \mathcal{F}^{\otimes} \\ \pi \swarrow & & & & \end{array}$$

It suffices to verify that  $\pi_* = \pi'_* \iota^*$ , or equivalently, that  $\pi^* \simeq \iota! \pi'^*$ . But this follows from direct inspection. As a corollary, we gain [\[NS22, Thm 5.3.9\]](#), which we use heavily in the following subsection.

**3.4. An  $I$ -symmetric monoidal category is cocartesian if and only if unital algebra structures are canonical.** Define the category  $\Gamma_G^* := \mathrm{CoFr}^G(\Gamma^*)$ . Given  $C$  an  $I$ -coproduct complete  $G$ -category, define the functor  $C^{\mathrm{II}} \rightarrow \Gamma_G^*$  to satisfy the following equivalence:

$$\mathrm{Map}_{\mathrm{Span}(\mathbb{F}_G)}(K, C^{\mathrm{II}}) \simeq \mathrm{Map}(K \times_{\mathbb{F}_G}, \Gamma_G^*, C).$$

An object of  $C^{\mathrm{II}}$  may be viewed as  $S_+ \rightarrow G/H_+$  a pointed  $H$ -set and  $(C_s)_{s \in \mathrm{Orb}(S)}$  an  $S$ -tuple of elements of  $C$ ; a morphism in  $C^{\mathrm{II}}$   $(C_s) \rightarrow (D_t)$  may be viewed as a map  $(S_+ \rightarrow G/H_+) \xrightarrow{f} (T_+ \rightarrow G/J_+)$  in  $\mathbb{F}_G$  together with a map

$$f_U : \coprod_{V \in f^{-1}(U)} N_V^U C_V \rightarrow D_U$$

for all  $U \in \mathrm{Orb}(T)$ . Unwinding definitions, we find the following lemma.

**Lemma 3.13.** *A morphism  $f : (C_s)_{s \in S} \rightarrow (D_t)_{t \in T}$  is  $\pi$ -cocartesian if and only if  $f_U$  is an equivalence for all  $U \in \mathrm{Orb}(T)$ . In particular,  $f$  is inert if and only if the following conditions are satisfied:*

- (1) *The projected morphism  $\pi(f) : S \rightarrow T$  is inert.*
- (2) *The associated map  $C_{f^{-1}(U)} \rightarrow D_U$  is an equivalence for all  $U \in \mathrm{Orb}(T)$ .*

Having characterized this, we may draw a diagram of Cartesian squares

$$\begin{array}{ccccc} \mathcal{O} & \xrightarrow{\iota} & \mathcal{O}_\Gamma^\otimes & \longrightarrow & \mathcal{O}^\otimes \\ \downarrow & \lrcorner & \downarrow & \lrcorner & \downarrow \\ \mathcal{O}_G^{\text{op}} & \hookrightarrow & \Gamma_G^* & \longrightarrow & \mathbb{F}_{G,*} \end{array}$$

Note that the objects of  $\mathcal{O}_\Gamma^\otimes$  consist of triples  $(S_+ \rightarrow G/H, U, X)$  where  $U \in \text{Orb}(S)$  and  $X \in \mathcal{O}_S$ , and the image of  $\iota$  is equivalent to the triples where  $S_+ \simeq G/K$  for some  $K \subset H$  (hence  $U = S$ ).

Note that cocartesian transport along inert morphism  $U_+ \hookrightarrow S_+$  induces an equivalence

$$\text{Map}_{\mathcal{O}_\Gamma^\otimes}(Y, (S_+ \rightarrow G/H, U, X)) \simeq \text{Map}_{\mathcal{O}_\Gamma^\otimes}(Y, (U_+ \rightarrow G/H, U, X_U)).$$

In particular,  $\iota$  witnesses  $\mathcal{O}$  as a *colocalizing subcategory*, with localization functor

$$R(S_+ \rightarrow G/H, U, X) \simeq (U_+ \rightarrow G/H, U, X).$$

We use this in the following lemma characterizing  $\mathcal{O}$ -algebras in  $\mathcal{C}^\Pi$ .

**Lemma 3.14.** *TFAE for a functor  $A : \mathcal{O}_\Gamma^\otimes \rightarrow \mathcal{C}$ .*

- (1) *The corresponding map  $\mathcal{O}^\otimes \rightarrow \mathcal{C}^\Pi$  is a map of I-operads.*
- (2) *For all morphisms  $\alpha$  in  $\mathcal{O}_\Gamma^\otimes$  whose image in  $\mathcal{O}^\otimes$  is inert,  $A(\alpha)$  is an equivalence in  $\mathcal{C}$ .*
- (3) *If  $f : (S_+ \rightarrow G/H_+, U, X) \rightarrow (U_+ \rightarrow G/H_+, U, X_U)$  is a cocartesian lift of the inert morphism, then  $A(f)$  is an equivalence.*
- (4)  *$A$  is left Kan extended from  $\mathcal{O}$ .*

Furthermore, every functor  $F : \mathcal{O} \rightarrow \mathcal{C}$  admits a left Kan extension along  $\mathcal{O} \hookrightarrow \mathcal{O}_\Gamma^\otimes$ ; in particular, the forgetful functor  $\underline{\text{Alg}}_{\mathcal{O}}(\mathcal{C}) \rightarrow \underline{\text{Fun}}_{\mathcal{C}}(\mathcal{O}, \mathcal{C})$  is an equivalence.

*Proof.* (1)  $\iff$  (2) follows immediately from ?? . (2)  $\iff$  (3) is immediate by definition. (3)  $\iff$  (4) is the computation of left Kan extension along the inclusion of a colocalizing subcategory. The pointwise formula for left Kan extension is precisely the composition  $RF : \mathcal{O}_\Gamma^\otimes \rightarrow \mathcal{C}$ .  $\square$

We would additionally like to characterize I-symmetric monoidal functors into  $\mathcal{C}^\Pi$ . This follows quickly from [lemma 3.14](#).

**Lemma 3.15.** *TFAE for a map of I-operads  $\varphi : \mathcal{O}^\otimes \rightarrow \mathcal{C}^\Pi$ :*

- (1)  *$\varphi$  is a map of I-symmetric monoidal categories.*
- (2) *The underlying G-functor  $F : \mathcal{O} \rightarrow \mathcal{C}$  preserves I-indexed coproducts.*

*In particular, restriction yields an equivalence*

$$\text{Fun}_I^\otimes(\mathcal{O}^\otimes, \mathcal{C}^\Pi) \xrightarrow{\sim} \text{Fun}_I^\Pi(\mathcal{O}, \mathcal{C}).$$

**Theorem 3.16** (C.f. [\[HA, Prop 2.4.3.9\]](#)). *The following are equivalent for  $\mathcal{C}^\otimes \in \text{CMon}_I(\mathbf{Cat})$ .*

- (1) *For all unital I-operads  $\mathcal{O}^\otimes$ , the forgetful functor  $\underline{\text{Alg}}_{\mathcal{O}}(\mathcal{C}) \rightarrow \underline{\text{Fun}}_{\mathcal{C}}(\mathcal{O}, \mathcal{C})$  is an equivalence.*
- (2) *The forgetful functor  $\text{CAlg}_I(\mathcal{C}) \rightarrow \mathcal{C}$  is an equivalence.*
- (3) *For all morphisms  $f : S \rightarrow T$  in  $\mathcal{I}$ , the action map  $f_\otimes : \mathcal{C}_S \rightarrow \mathcal{C}_T$  is left adjoint to the pullback  $f^* : \mathcal{C}_T \rightarrow \mathcal{C}_S$ .*
- (4) *There is an I-symmetric monoidal equivalence  $\mathcal{C}^\otimes \simeq \mathcal{C}^\Pi$  extending the identity on  $\mathcal{C}$ .*

*Proof of theorem 3.16.* (1)  $\implies$  (2) by choosing  $\mathcal{O} = \mathcal{N}_{I\infty}$ . (2)  $\implies$  (3) is precisely [\[NS22, Thm 5.3.9\]](#), noting that The forgetful functor  $\text{CAlg}_I(\mathcal{C}) \rightarrow \mathcal{C}$  is I-symmetric monoidal by construction. (3)  $\implies$  (4) follows by applying [lemma 3.15](#) to the identity functor in the case  $\mathcal{O} = \mathcal{C}$ . (4)  $\implies$  (1) is precisely [lemma 3.14](#).  $\square$
